

## Sulphuric Acid Tank

Inside dimensions 17'3" x 6'10" x 5'11"

Material - Hardwood frame with lining  
of 1" hardwood, 1" pine and 7 lb. lead.

### Timber required

2 - 19'3" - 6"x4"

2 - 8'10" - 6"x4"

1 - 8'8" - 4"x4"

2 - 19'3" - 6"x5"

4 - 8'10" - 6"x5"

9 - 9'0" - 6"x3"

3 - 19'3" - 9"x5"

26 - 5'7" - 4"x3"

410 ft. 1" hardwood

410 - 1" pine

Timber for Acid Tank

9" x 5" 3/19's

6" x 5" 2/19's 4/8'10"

6" x 4" 2/19's 2/8'10"

6" x 3" 9/9'

4" x 4" 1/8'8"

4" x 3" 2/5'7"

410 ft 1" hardwood

410 ft 1" pine

# Minerals

No.	Mineral	Locality	Ref. No.	Formula	Remarks

Brass -

Types of minerals  
found in sands.

1. Journaline, Black (mass.), olive brown (micro)

From stream in concentrates, Smithfield W. Va.

M.

2. Staurolite, brown.

From alluvial concentrates, Green bushes.

M. 6260.

## Sphere

Sphere is the most perfect form of lines  
and curves. It alone (1) possesses infinite symmetry  
every portion of which is similar to the  
whole, (2) has no imperfections, (3) and is in equal connection  
with its center, (4) can balance with perfect equilibrium  
upon any point of its surface.

Symbolical of perfection, of idealism, of S.A.  
equilibrium, of balanced development.

Perpendicular, triangles can be said to represent

Triangle, symbol of balance, is of aspiration.  
These aspects of the ego are material, intellectual  
heart is also applied in the three dimensions.

Revolving funnel Vertical Joint  
 Fred H. M. S. Mt. Morgan

Fig 10

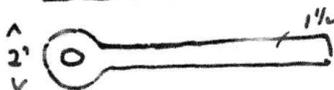

1/8 inch rivets spaced  
 7" centers

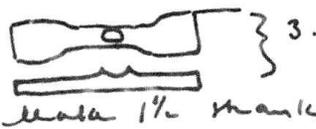

## Blacksmithing

Common joint  
Jaws 2"x1" wide

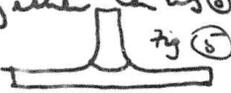

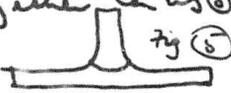

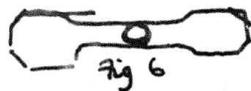

to be done at  
center as in fig 3.

Knock a hot  
punch into

make 1/2" mark like 4  fig 4

Get shank hot & flat bar hot & weld  
them together  using punch to  
finish  fig 5 Cut shank  
& heat to blue & then cut across  
off head (b) & red-hot, using thickness

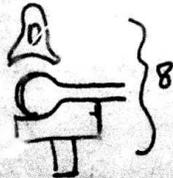

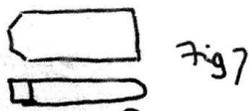

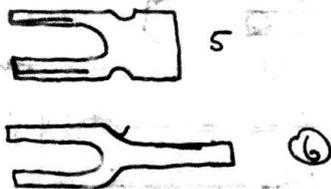

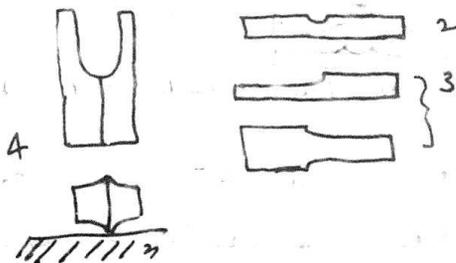

piece <sup>(p)</sup> to keep jaws  
apart. Have thick-

ness piece = width of jaw & 2" longer.

Rest job on anvil pressing t.p. up  
against any bar in the hole of the  
anvil. Swap up joint fig 8.

Final hole drilled out punched.

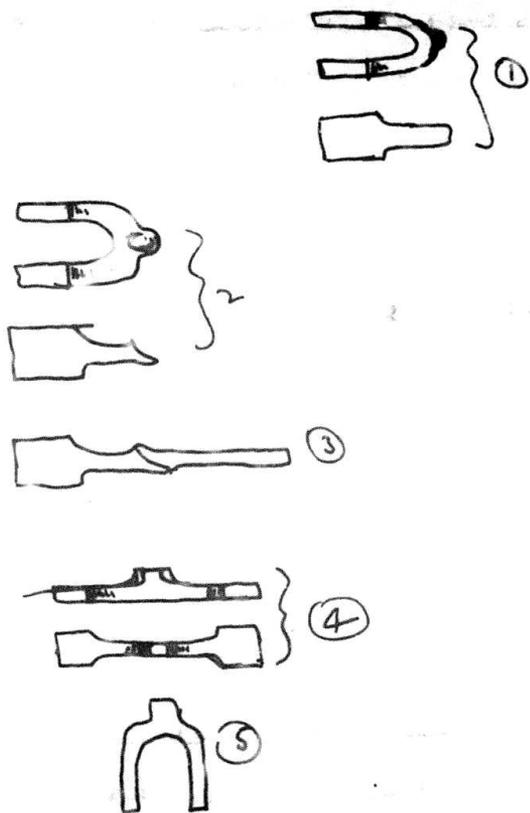

Common joint for smaller jobs.  
As large but when welding on shank  
do it in bolster. (1)

Common joint 2<sup>nd</sup> Method.

If suitable size of iron not available:-  
Take 1 1/4 square. Drive filler in 2  
& then flatten it as in 3. Make 2<sup>nd</sup>  
piece same. Get welding heat &  
lay on sides on anvil 4. Tap together  
Turn on flat & strike together well.  
Turn up on end & put filler in jaw  
to well inside of joint well.

Then take necessary pieces &  
filler in 5 then saw at shank.

6. Then put in thickness piece &  
round up junction of jaw & shank  
Cut off jaw to exact length. Describe  
circle of correct size on head of  
jaw & set off on set-rod. Then  
round up as before.

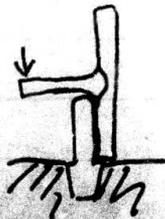

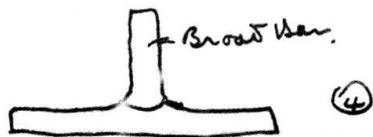

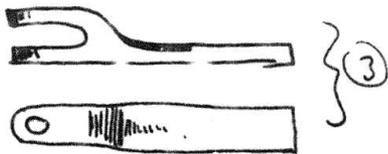

Common joint - 3<sup>rd</sup> method.

Take piece of flat iron for jaws & turn round ~~it~~ & knock in sideways  
 ①. Scarf with orb punch ②. Scarf up shank & round up slant to fit into heat scarf. ③. Finish up exactly as before.

Common joint - 4<sup>th</sup> method.

Take square iron filler & flatten at ends ④. Bend it as in ⑤. Scarf point & ~~the~~ shank just as ordinary piece of iron. Weld & finish as before

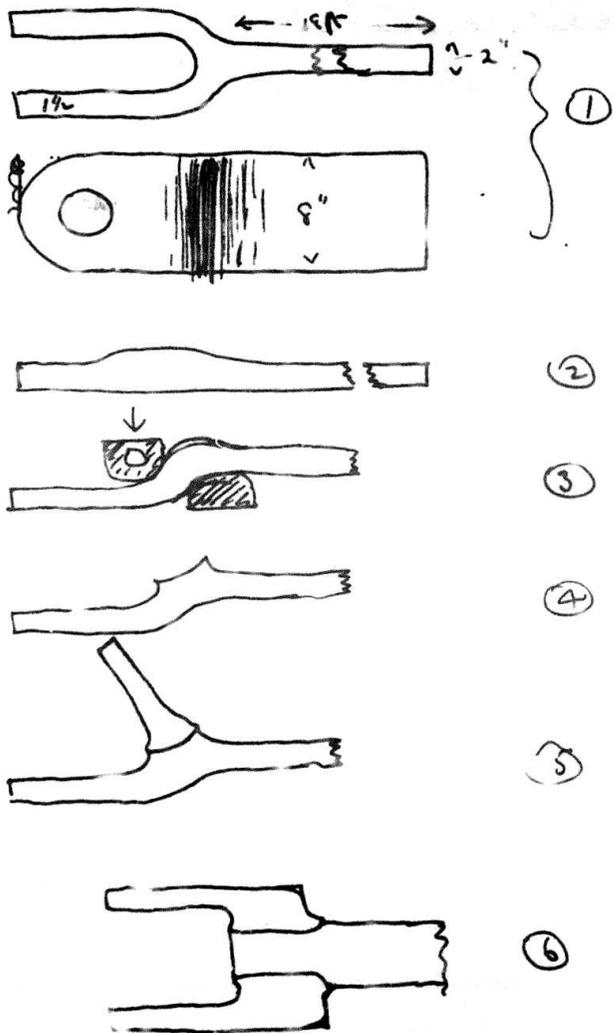

### Common Joints 5<sup>th</sup> Method

If joint is made out of solid only one  
 round or taper iron can be used.

Take iron full on side size of ~~the~~ head  
 of joint. Fill in at end of head of  
 jaw. Draw shank out & punch  
 hole right through (1). With hot  
 set cut out piece & leave jaw (2).  
 Level up jaw on saddle. Finish  
 up as before.

### 2<sup>nd</sup> Joint (3)

Weld a shank as in fig (4). Fill  
 up joint & bend over piece as in (5)

Big joint. ①  
 5/8" diam jumped up from 2" x 3" with a  
 beam. ②

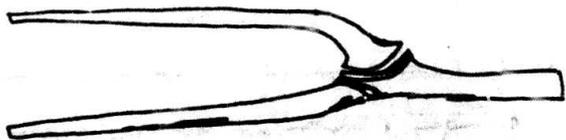

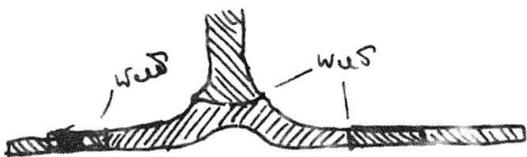

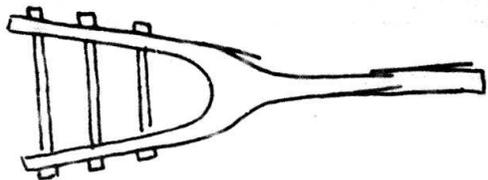

Bend it as in ① with steam hammer  
 Scarf it with a file starting at  
 end farthest from handle

Get short piece for other joint, get  
 that heat on end, & put under  
 steam hammer to upset it.

Weld up as in ⑤.

Other method can be made by  
 method ② & scribed upon common  
 joint.

3<sup>rd</sup> method shown in ⑥ comes  
 from center of hollow of jaw cut out  
 with gouge & driven by chisel.

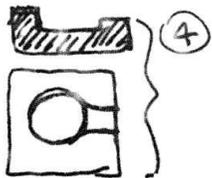

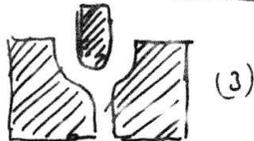

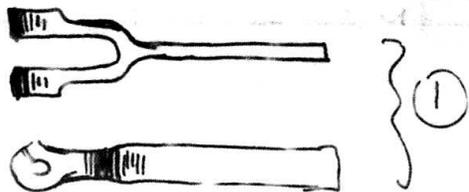

## Fork Strap for Mine Pumps. ①

4 pieces taken as shown in fig ②  
 Saw on handle on horn of anvil.  
 then scarf ends of jaws & scarf 2  
 pieces to weld on to them to give  
 necessary length to jaws.

2<sup>nd</sup> method. Make 2 half jaws like  
 ③. Put them together. Fuller  
 with beak of hammer & draw  
 out handle.

3<sup>rd</sup> method. Take 4<sup>th</sup> pieces of iron.  
 Jump up ends & bend them as in 4.  
~~then weld on to~~ weld on to a  
 time on to the handle.

Proc. Eccentric joint. ①

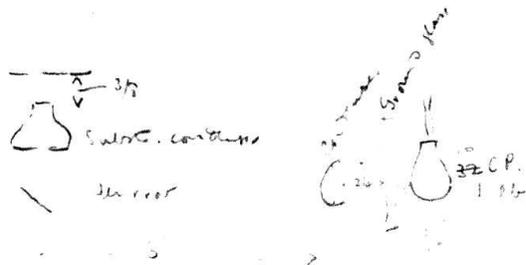

Stage 1 mem in fig ②

shaped up in special dies (3) & ④

### Sulphur Solution (Reipur, Mt. Magan)

add 10 g. finely ground indigo to 4 lbs.

from 10 g.  $H_2SO_4$  stirring in a porcelain  
dish <sup>slant for 40 hours</sup> dilute slowly with  $\frac{7}{10}$  liter water.

filter through muslin & then through filter paper.

titrate with chlorine solution with  $\frac{10}{100}$   $AS_2O_3$ .

titrate the cl. solution with the indigo

until color becomes yellow the value

of the indigo solution is thus obtained.

Keep one of this solution as a standard

& make standard solution of potassium permanganate

ground  $MnO_2$  dissolved in 1 liter

with this solution titrate standard

indigo, the final value of indigo

is found & test all future

lots of indigo by the standard per-

manganate.

cl. solution + 80 grains ~~per~~ <sup>c. ft.</sup>

### Scale change

119 lbs. salt & manganate & acid  
when ~~used~~ <sup>used</sup> ~~for~~ <sup>for</sup> ~~all~~ <sup>all</sup> ~~uses~~ <sup>uses</sup>

Ironing Hand Paper (cont.)

N.B. Keep <sup>1<sup>st</sup></sup> wash water and ironing solution as cold as possible, with ice if necessary in the summer time. The temperature of the water should not be over 70° F.

After final washing press the prints between blotting paper to remove excess of water from the surface and then spread out on a cloth, face up - 20, to dry.

Printing on Platinotype Co's  
A.A. Platino-paper.

Stock Solutions.

## Estimation of Gold in Lignors.

200 c.c. of the sample are taken and put in a 500 c.c. beaker. 5 c.c. of concentrated HCl are added, the beaker covered with a clock glass and the solution boiled gently until all free chlorine is removed. The solution is then cooled and  $H_2S$  passed thro' it until it contains an excess of the gas. All gold, silver and copper is thus precipitated.

The residue is filtered and well washed with distilled water. A hole is pressed in the bottom of the filter and as much as possible of the residue washed into a 100 c.c. beaker. The filter is ignited and its ash dropped into the beaker also. 7-10 c.c. concentrated  $HNO_3$  is then added and the solution boiled until all the

water is dissolved. The precipitate is allowed to settle when the solution is decanted off. The residue of gold containing a little  $HgCl_2$  and filter ash is washed by decantation first with water then with strong  $NH_4OH$  solution, after which it is washed down into a porcelain capsule. The water is poured off and the gold ignited. After cooling in a desiccator the gold is weighed on the scale pan and weighed.

The results obtained in April 1896, see the next page.

## Determination of $\text{KNO}_3$ in Manganese Ores.

The method followed is that numbered B in Sutton's Volumetric analysis.

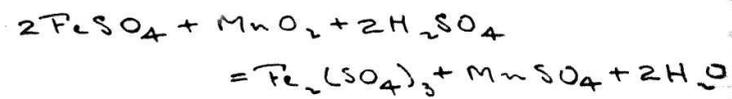

1.5 grams or less - according to the richness of the ore - of clean "flower wire" (99.9% Fe) is placed in a 500 c.c. flask with ~~100~~<sup>100</sup> c.c. of ~~10N~~<sup>10N</sup>  $\text{H}_2\text{SO}_4$ . The flask is fitted with a rubber cork and a rubber non-return valve, and warmed until all the iron is dissolved.

1 gram of the finely powdered pyrolusite is then added and the stopper replaced. The flask is boiled gently until the whole of the manganese is dissolved which is known by the absence of black speck in the residue.

The solution is cooled and transferred to a 750 c.c. beaker, diluted to about 400 c.c. and titrated with

$\frac{N}{10}$ .  $K_2Cr_2O_7$  to ascertain the amount of iron unoxidized. Subtracting this from the total iron added, we obtain the amount of iron oxidized during the solution of the manganese. This amount multiplied by the factor 0.7768 gives the amount of  $MnO_2$  in the ore.

The equation for the oxidation of the iron is

so that 87 grams of  $MnO_2$  will oxidize 112 grams of Fe; or 1 gram of Fe  $\equiv$  0.7768 grams  $MnO_2$ .

Factors.

- 1 gram. Fe  $\equiv$  0.7768 grams  $MnO_2$
- 1.2873 gms. Fe  $\equiv$  1.0000 "  $MnO_2$
- 1.2886 " GunWire  $\equiv$  1.0000 "  $MnO_2$

When a 1 gram of ore is taken, then

- 1%  $MnO_2 \equiv$  0.0129 gms. Fe oxidized
- 5%  $MnO_2 \equiv$  0.0644 " " "

Litharge	29 lb.
Soda	34 "
Flour	15 oz.

[1 gr. flour will reduce 10 grains litharge]

Charges

1. Oxidised Ores: Quartz, Sinter,  
Kalin, light ironstone.

Ore	400 grains
Std. Flux.	1000 "
Soda	300 "
Salt Cover	750 "

Pot. Batt. Rd. F.

- when  $\text{TiO}_2$  is present add

Borax	300 grains
-------	------------

2. Heavy Ironstone. Mine or less  
fine limonite.

Ore	400	grains
Sto. Flux	1000	"
Flour	5	"
Soda	300	"
Salt Cover	750	"

Pot. Batt. Rd. G.

3. Pyritic Ores.

	(1) Poor	(2) Rich
Ore	400 gr.	240 gr.
Soda	900 -	600 -
Recharge	300 -	300 -
Flour	35 -	35 -
Borax	500 -	350 -
Salt Cover	750 -	750 -
Shov	1. 6" iron dog-spike	

Pot. Batt. Rd. G.

## 4 Residues.

1 Ordinary ore residues; value about 1 dwt.

2. Sulphide-ore residues; value 3-5 dwts.

	<u>1</u>	<u>2</u>
Ore	1200 gr.	800 gr.
Std. Flux	1500 -	1250 -
Soda	600 "	600 "
Borax	500 -	500 -
Salt Cover	750 "	750 -

Pot. Batt. Rd. G

5. Smelting Room Products. 1 case of charcoal filters; 2 case of val timber and of fuel used in smelting; smelt w. Rag.

	<u>1</u>	<u>2</u>
Ore	100 gr.	400 gr.
Std. Flux	1000 -	1000 -
Soda	300 -	300 -
Borax	150 -	300 -
Salt Cover	500 -	750 -

## Consumption of Material in Assay Office.

Consumption per month of 4 weeks when average no of assays is 70 daily.

Goke	60 bags =
Charcoal	85 " =
Cinnabars G	$2\frac{1}{2}$ casks = <del>1250</del> <sup>1500</sup> crux.
F	$\frac{3}{4}$ " = 600 "
C.I. Firebars	
Bone-ash	1 cask = 1 cwt.
Litharge	1 keg = 1 cwt.
Soda	3 " = 3 cwt.
Borax	$\frac{1}{3}$ box = 37 lb [ $\frac{1}{3}$ of 1 cwt.]
Salt	2 bags = 400 lb
Flour	
Iron Spikes	$\frac{1}{2}$ cwt.
Nitric Acid	2 wins. = 4 qts = 15 lb.
Ammonia (880)	$\frac{1}{2}$ " = 1 " = 2.2 "

\* The "separators" are vats, 4 ft. diam, with  
 layer of fine gravel at the bottom,  
 thro' which the acid liquor filter  
 before being run thro' the charcoal  
 filters, all suspended matter being  
 thus arrested. In the separators the  
 liquors are steam heated to drive  
 off excess of chlorine and make  
 them hot enough to be precipitated by  
 the charcoal in the filters.

Cupel Bone-AshDegree of Fineness.

No. 1.

Best, fine. - Color, dead white

Left on 60 sieve N. e

" " 80 " 22.6 %

No. 2.

Bad quality, coarse - Color, pale ash

Left on 60 sieve 9.0 %

" " 80 " 28.5 % \*

\* N. B. This includes the % left on a 60 sieve.

No. 1. Bone-ash makes cupels of excellent quality, whilst those made from No. 2. are very liable to crack in the muffle. A mixture of the two in equal proportions makes very fair medium cupels, suitable for ordinary rough work.

Roasting Pyritic Ore

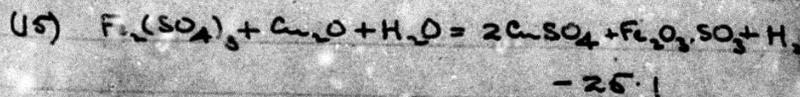

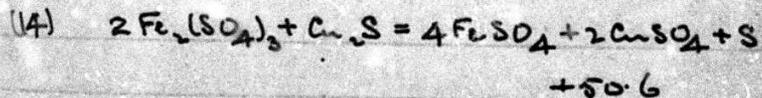

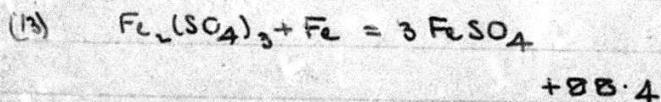

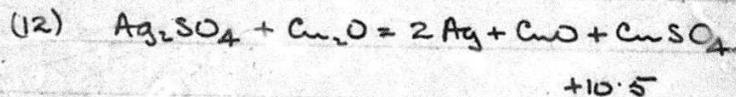

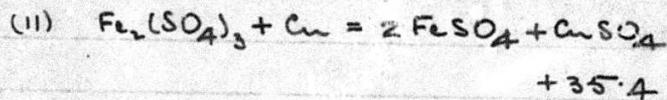

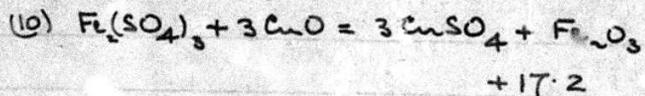

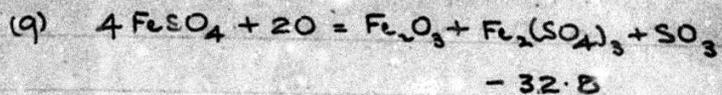

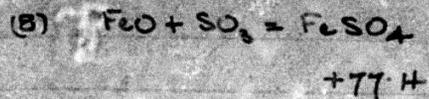

Consumption of Fuel

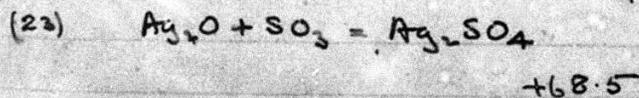

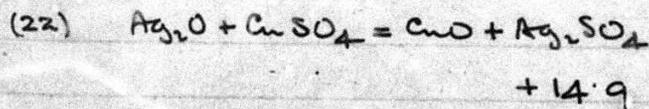

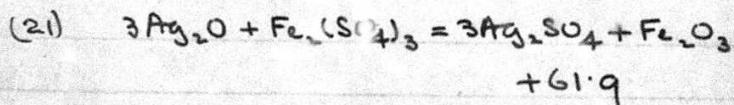

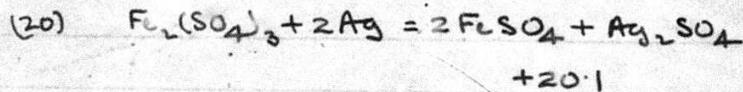

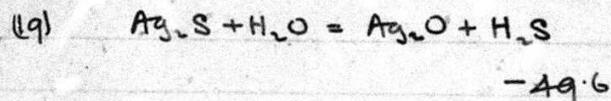

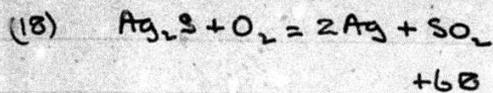

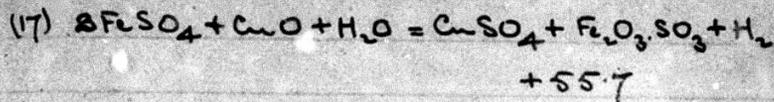

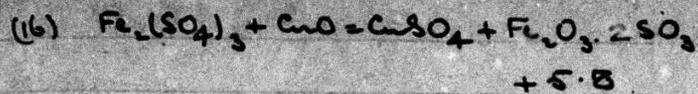

average for 6 months ending  
April 30<sup>th</sup> '96

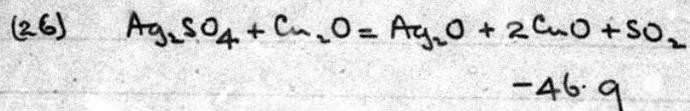

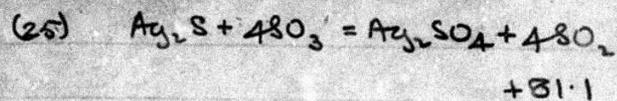

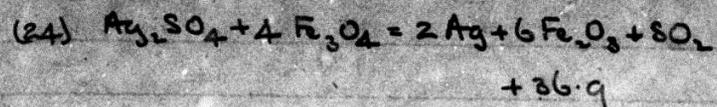

1 ton ore consumes 141 cu ft 21 lb. steam

## Roasting Chemical Reactions

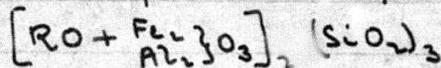

## Occurrence of Rare Earth Metals

Cerium (Ce), Lanthanum (La) and  
Dysprosium (Di) occur in

1. Cerite, H. 5.5 - 8p 4.4-91

2. Allanite, H. 5.5-6.0 S. 4.3.0-4.2

3. Monazite<sup>H</sup>, 5.0-5.5 S. 4.4-5.3

4. Fergusite, H. 5.5-6.0 S. 4.5.8

5. Samarskite, H. 5.5-6.0 S. 4.5.5+5.7

6. Dysomite

7. Parisite H. 4.5 S. 4.4.3

8. Bastnasite.

Yttrium Cerium (E.F.) occur  
principally in

1. Sodalite. H. 6.5-7.0 S.G. 4.0-4.5  
 $[(Y, Ce, Fe)_2O]_2 \cdot SiO_2$
2. Xenotime. H. 4-5 S.G. 4.45-4.55  
 $Y_2O_3 \cdot CeO_2 \cdot P_2O_5$
3. Yttrantinite. H. 5-5.5 S.G. 5.4-5.9  
 $(RO)_{10} \cdot (TaO_5)_3$
4. Xenite. H. 6.5 G 4.6  
 $(RO) \cdot [(Ta, Nb)_2O_5]_3$
5. Polycrase. H 5.5 G 5.1  
 $RO \cdot Nb_2O_5 \cdot U_2O_5$
6. Sipylite. H

Thorium (Th) occurs principally in

1. Thinite H 4.5-5.0 G 4.3-5.4

2. Monazite *vide supra*

3. Aeschynite H 5-6 G 4.9-5.1

4. Pyrochlore H 6.5 G 4.7-4.9

5. Thoregumite

Stibnite H 6-7 G 6.4-7.1

Tantalite - H 6-6.5 G 7-8

Thorium (Th) occurs principally in

1. Thinite H 4.5-5.0 G 4.3-5.4

2. Monazite *vide supra*

3. Aeschynite H 5-6 G 4.9-5.1

4. Polymignite H 6.5 G 4.7-4.9

5. Thorogummite

Stannite H 6-7 G 6.4-7.1

Santalite - H 6-6.5 G 7-8
